## DECLARATION OF CONFORMITY

Nidec ASI S．p．A．hereby states that the AD700E product range conforms to the relevant safety provisions of the Low Voltage Directive 2006／95／EC and the EMC Directive 2004／108／EC and has been designed and manufactured in accordance with the following harmonised European standards：

| EN 61800－5－1： 2003 | Adjustable speed electrical power drive systems．Safety requirements．Electrical，thermal and energy． |
| :--- | :--- |
| EN 61800－3 2 ${ }^{\text {nd }}$ Ed： 2004 | Adjustable speed electrical power drive systems．EMC requirements and specific test methods |
| EN 55011：2007 | Limits and Methods of measurement of radio disturbance characteristics of industrial，scientific and medical（ISM） <br> radio－frequency equipment（EMC） |
| EN60529：1992 | Specifications for degrees of protection provided by enclosures |

## AD700E

## Previous view

### 1.1 ELECTROMAGNETIC COMPATIBILITY

All AD700E drives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union can be ordered with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with the above harmonised European standards.

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. When using an AD700E with an internal or optional external filter, compliance with the following EMC Categories, as defined by EN61800-3:2004 can be achieved:

All rights reserved. No part of this User Guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by any information storage or retrieval system without permission in writing from the publisher.

For the warranty period and the conditions, refer to the Order Acceptance. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

This user guide is the "original instructions" document.
All non-English versions are translations of the "original instructions".
The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.
This User Guide is for use with version 3.00 Firmware.

## User Guide Revision 1.01

NIDEC adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

## 2 IMPORTANT SAFETY INFORMATION

## Please read the IMPORTANT SAFETY INFORMATION below,

 and all Warning and Caution information elsewhere.Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

This variable speed drive product (AD700E) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The AD700E uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical equipment that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the AD700E, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the AD700E. Any electrical measurements required should be carried out with the AD700E disconnected.

Electric shock hazard! Disconnect and ISOLATE the AD700E before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.
Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5 mA ; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

## Sprevious view

Within the European Union, all machinery in which this product is used must comply with Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the AD700E control input functions - for example stop/start, forward/reverse and maximum speed is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.
The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The AD700E can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.
P20/NEMA 2 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54/NEMA 3 or better
AD700E are intended for indoor use only.
When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive
Relative humidity must be less than 95\% (non-condensing).
Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the AD700E as delivered
Never connect the mains power supply to the Output terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}$
Do not install any type of automatic switchgear between the drive and the motor
Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees Ensure that all terminals are tightened to the appropriate torque setting

Do not attempt to carry out any repair of the AD700E. In the case of suspected fault or malfunction, contact your local Nidec representative www.nidec-industrial.com for further assistance.

## 4 MECHANICAL INSTALLATION

### 4.1 GENERAL

- The AD700E should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Sizes 1 and 2 only).
- IP20 AD700E must be installed in a pollution degree 1 or 2 environment only
- Do not mount flammable material close to the AD700E
- Ensure that the minimum cooling air gaps, as detailed in section 4.4 and 4.6 are left clear

| Drive |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 4.4 GUIDELINES FOR ENCLOSURE MOUNTING IP20 UNITS

- IP20 drives are suitable for use in pollution degree 1 environments according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive
- In any environments where the conditions require it, the enclosure must be designed to protect the AD700E against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. NIDEC INDUSTRIAL SOLUTIONS recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:

NOTE:
Dimension $Z$ assumes that the drives are mounted side-by-side with no clearance
Typical drive heat losses are $3 \%$ of operating load conditions
Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

### 4.6 GUIDELINES FOR MOUNTING (IP66 UNITS)

- Before mounting the drive, ensure that the chosen location meets the
environmental condition requirements for the drive shown in section 10.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives
- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are pre-moulded into the drive enclosure, recommended gland sizes are shown above. Gland holes for control cables may be cut as required

NOTE:
Typical drive heat losses are approximately 3\% of operating load conditions.
Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times

### 4.7 GLAND PLATE AND LOCK OFF

The use of a suitable gland system is required to maintain the appropriate IP / Nema rating. The gland plate has pre moulded cable entry holes for power and motor connections suitable for use with glands as shown in the following table. Where additional holes are required, these can be drilled to suitable size. Please take care when drilling to avoid leaving any particles within the product.

Cable Gland recommended Hole Sizes \& types:

|  | Power \& Motor Cables |  |  | Control \& Signal Cables |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Moulded Hole Size | Imperial Gland | Metric Gland | Knockout Size | Imperial Gland | Metric Gland |
| Size 1 | 22 mm | PG13.5 | M20 | 22 mm | PG13.5 | M20 |
| Size 2 \& 3 | 27 mm | PG21 | M25 | 22 mm | PG13.5 | M20 |
| Flexible Conduit Hole Sizes: |  |  |  |  |  |  |
|  |  |  |  | Drill Size | Trade Size | Metric |
| Size 1 |  |  |  | 28 mm | $3 / 4$ in | 21 |
| Size 2 \& 3 |  |  |  | 35 mm | 1 in | 27 |

- UL rated ingress protection ("Type" ) is only met when cables are installed using a UL recognized bushing or fitting for a flexible-conduit system which meets the required level of protection ("Type")
- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC
- Not intended for installation using rigid conduit system

Power Isolator Lock Off
On the switched models the main power isolator switch can be locked in the 'Off' position using a 20 mm standard shackle padlock (not supplied)

IP66 / Nema 4X Unit Lock Off

### 4.8 REMOVING THE TERMINAL COVER

To access the connection terminals, the drive front cover needs to be removed as shown
IP66 / Nema 4X Units

Removing the 2 screws on the front of the product allows access to the connection terminals, as shown below.

### 4.9 ROUTINE MAINTENANCE

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the "Environment" section
- Heat sink fans freely rotating and dust free
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

## 5 POWER WIRING

### 5.1 GROUNDING THE DRIVE

4
This manual is intended as a guide for proper installation. NIDEC INDUSTRIAL SOLUTIONS cannot assume responsibility for the compliance or the noncompliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/ or equipment damage exists if codes are ignored during installation.

This AD700E contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

$\triangle$Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

## Grounding Guidelines

The ground terminal of each AD700E should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). AD700E ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections. The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically. Protective Earth Conductor.
The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

## Safety Ground

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes

## Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

## Ground Fault Monitoring

As with all drive's, a leakage current to earth can exist. The AD700E is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply: - A Type B Device must be used

- The device must be suitable for protecting equipment with
a DC component in the leakage current
- Individual ELCBs should be used for each AD700E

## AD700E

## §PREVIOUS VIEW

### 5.2 EMC FILTER DISCONNECT

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected (on IP20 units only) by completely removing the EMC screw on the side of the product
Remove the screws as indicated below

The AD700E product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply.

When carrying out a HiPot (Flash) test on an installation in which the drive is built, the voltage surge suppression components may cause the test to fail. To accommodate this type of system HiPot test, the voltage surge suppression components can be disconnected by removing the VAR screw. After completing the HiPot test, the screw should be replaced and the HiPot test repeated. The test should then fail, indicating that the voltage surge suppression components are once again in circuit.
Shield Termination (Cable Screen)
The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

### 5.3 WIRING PRECAUTIONS

Connect the AD700E according to sections 5.9.1 and 5.9.2, ensuring that motor terminal box connections are correct. There are two connections in general: Star and Delta. It is essential to ensure that the motor is connected in accordance with the voltage at which it will be operated. For more information, refer to section 5.6 Motor Terminal Box Connections.

It is recommended that the power cabling should be 4-core PVC-insulated screened cable, laid in accordance with local industrial regulations and codes of practice.

### 5.4 INCOMING POWER CONNECTION

- For 1 phase supply, power should be connected to L1/L, L2/N.
- For 3 phase supplies, power should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, a symmetrical shielded cable is recommended
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the AD700E and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Guideline dimensions are given in section 10.2 .
- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 10.2 Rating Tables. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type J fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- When the power supply is removed from the drive, a minimum of 30 seconds should be allowed before re-applying the power. A minimum of 5 minutes should be allowed before removing the terminal covers or connection.
- The maximum permissible short circuit current at the AD700E Power terminals as defined in IEC60439-1 is 100kA.
- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:
- The incoming supply impedance is low or the fault level / short circuit current is high
- The supply is prone to dips or brown outs
- An imbalance exists on the supply (3 phase drives)
- The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

| Supply | Frame Size | AC Input Inductor |
| :---: | :---: | :---: |
| $\begin{aligned} & 230 \text { Volt } \\ & 1 \text { Phase } \end{aligned}$ | 1 | AD07-L1016-20 |
|  | 2 | AD07-L1025-20 |
|  | 3 | N/A |
| 400 Volt 3 Phase | 2 | AD07-L3006-20 |
|  | 2 | AD07-L3010-20 |
|  | 3 | AD07-L3036-20 |

## §PREVIOUS VIEW

### 5.5 DRIVE AND MOTOR CONNECTION

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the AD700E $U, V$, and $W$ terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the AD700E earth terminals.
- For compliance with the European EMC directive, a suitable screened (shielded) cable should be used. Braided or twisted type screened cable where the screen covers at least $85 \%$ of the cable surface area, designed with low impedance to HF signals are recommended as a minimum. Installation within a suitable steel or copper tube is generally also acceptable
- The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area
- Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- For IP66 drives, connect the motor cable screen to the internal ground clamp

### 5.6 MOTOR TERMINAL BOX CONNECTIONS

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor. This operationa voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

| Incoming Supply Voltage | Motor Nameplate Voltages |  | Connection |
| :---: | :---: | :---: | :---: |
| 230 | $230 / 400$ | Delta |  |
| 400 | 400 / 690 |  |  |
| 400 | $230 / 400$ | Star |  |

### 5.7 MOTOR THERMAL OVERLOAD PROTECTION

### 5.7.1 INTERNAL THERMAL OVERLOAD PROTECTION

The drive has an in-built motor thermal overload function; this is in the form of an "I.t-trP" trip after delivering $>100 \%$ of the value set in P-08 for a sustained period of time (e.g. 150\% for 60 seconds).

### 5.7.2 MOTOR THERMISTOR CONNECTION

Where a motor thermistor is to be used, it should be connected as follows:

### 5.8 CONTROL TERMINAL WIRING

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5 Nm .
- Control Cable entry conductor size: $0.05-2.5 \mathrm{~mm} 2$ / $30-12$ AWG

## 7 PARAMETERS

### 7.1 STANDARD PARAMETERS

| Par | Description |  | Minimum | Maximum | Default | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P-01 | Maximum Frequency / Speed Limit |  | P-02 | 500.0 | 50.0 (60.0) | Hz / RPM |
|  | Maximum output frequency or motor speed limit - Hz or RPM. If P-10 $>0$, the value entered / displayed is in RPM |  |  |  |  |  |
| P-02 | Minimum Frequency / Speed Limit |  | 0.0 | P-01 | 0.0 | Hz / RPM |
|  | Minimum speed limit - Hz or RPM. If P-10 $>0$, the value entered / displayed is in RPM |  |  |  |  |  |
| P-03 | Acceleration Ramp Time |  | 0.00 | 600.0 | 5.0 | S |
|  | Acceleration ramp time from zero Hz / RPM to base frequency (P-09) in seconds. |  |  |  |  |  |
| P-04 | Deceleration Ramp Time |  | 0.00 | 600.0 | 5.0 | S |
|  | Deceleration ramp time from base frequency (P-09) to standstill in seconds. When set to 0.00 , the value of $\mathrm{P}-24$ is used. |  |  |  |  |  |
| P-05 | Stopping Mode |  | 0 | 3 | 0 | - |
|  | Selects the stopping mode of the drive, and the behaviour in response to a loss of mains power supply during operation. |  |  |  |  |  |
|  | Setting | On Disable | On Mains Loss |  |  |  |
|  | 0 | Ramp to Stop (P-04) | Ride Through (Recover energy from load to maintain operation) |  |  |  |
|  | 1 | Coast | Coast |  |  |  |
|  | 2 | Ramp to Stop (P-04) | Fast Ramp to Stop (P-24), Coast if P-24 = 0 |  |  |  |
|  | 3 | Ramp to Stop (P-04) with AC Flux Braking | Fast Ramp to Stop (P-24), Coast if P-24 =0 |  |  |  |
| P-06 | Energy Optimiser |  | 0 | 1 | 0 | - |

## 0 : Disabled

1 : Enabled. When enabled, the Energy Optimiser attempts to reduce the overall energy consumed by the drive and motor by reducing the output voltage during constant speed, light load operation. The Energy Optimiser is intended for applications where the drive may operate for some periods of time with constant speed and light motor load, whether constant or variable torque.

| P-07 | Motor Rated Voltage / Back EMF <br> at rated speed (PM / BLDC) | 0 | $250 / 500$ | $230 / 400$ | V |
| :--- | :--- | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |

For Induction Motors, this parameter should be set to the rated (nameplate) voltage of the motor (Volts).
For Permanent Magnet or Brushless DC Motors, it should be set to the Back EMF at rated speed

| P-08 | Motor Rated Current | Drive Rating Dependent | A |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |

This parameter should be set to the rated (nameplate) current of the motor

| P-09 | Motor Rated Frequency | 25 | 500 | 50 (60) | Hz |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | This parameter should be set to the rated (nameplate) frequency of the motor |  |  |  |  |
| P-10 | Motor Rated Speed | 0 | 30000 | 0 | RPM |

This parameter can optionally be set to the rated (nameplate) RPM of the motor. When set to the default value of zero, all speed related parameters are displayed in Hz , and the slip compensation (where motor speed is maintained at a constant value regardless of applied load) for the motor is disabled. Entering the value from the motor nameplate enables the slip compensation function, and the Optidrive display will now show motor speed in RPM. All speed related parameters, such as Minimum and Maximum Speed, Preset Speeds etc. will also be displayed in RPM. NOTE If P-09 value is changed, $\mathrm{P}-10$ value is reset to 0

## \&PREVIOUS VIEW

| Par | Description | Minimum | Maximum | Default | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| P-11 | Low Frequency Torque Boost Current | 0.0 | 20.0 | Drive Dependent | $\%$ |

Low Frequency Torque Boost is used to increase the applied motor voltage and hence current at low output frequencies. This can improve low speed and starting torque. Increasing the boost level will increase motor current at low speed, which may result in the motor temperature rising force ventilation of the motor may then be required. In general, the lower the motor power, the higher the boost setting that may be safely used. For IM motors, when P-51 = 0 or 1, a suitable setting can usually be found by operating the motor under very low or no load conditions at approximately 5 Hz , and adjusting $\mathrm{P}-11$ until the motor current is approximately the magnetising current (if known) or in the range shown below. Frame Size 1: 60-80\% of motor rated current
Frame Size 2:50-60\% of motor rated current
Frame Size 3: 40-50\% of motor rated current
Frame Size 4: 35-45\% of motor rated current
This parameter is also effective when using alternative motor types, $\mathrm{P}-51=2,3$ or 4
In this case, the boost current level is defined as 4*P-11*P-08

| P-12 | Primary Command Source | 0 | 9 | 0 | - |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

0: Terminal Control. The drive responds directly to signals applied to the control terminals.
1: Uni-directional Keypad Control. The drive can be controlled in the forward direction only using an external or remote Keypad
2: Bi-directional Keypad Control. The drive can be controlled in the forward and reverse directions using an external or remote Keypad.
Pressing the keypad START button toggles between forward and reverse.
3: Modbus Network Control. Control via Modbus RTU (RS485) using the internal Accel / Decel ramps
4 : Modbus Network Control. Control via Modbus RTU (RS485) interface with Accel / Decel ramps updated via Modbus
5 : PI Control. User PI control with external feedback signal
6 : PI Analog Summation Control. PI control with external feedback signal and summation with analog input 1
7 : CAN open Control. Control via CAN (RS485) using the internal Accel / Decel ramps
8 : CAN open Control. Control via CAN (RS485) interface with Accel / Decel ramps updated via CAN
9 : Slave Mode. Control via a connected NIDEC ASI SPA in Master Mode. Slave drive address must be > 1
NOTE: When $\mathrm{P}-12=1,2,3,4,7,8$ or 9 , an enable signal must still be provided at the control terminals, digital input 1

| P-13 | Operating Mode Select | 0 | 2 | 0 |
| :--- | :--- | :--- | :--- | :--- |

0 overload
$\mathbf{0}$ : Industrial Mode. Intended for most standard applications, parameters are configured for constant torque operation with $150 \%$ overload allowed for 60 seconds, spin start is disabled.
1: Pump Mode. Intended for pump applications, parameters are configured for variable torque operation with $110 \%$ overload allowed for 60 seconds, spin start is disabled.
2 : Fan Mode. Intended for Fan applications, parameters are configured for variable torque operation with $110 \%$ overload allowed for 60 seconds, spin start is enabled.

Enables access to Extended and Advanced Parameter Groups. This parameter must be set to the value programmed in P-37 (default: 101) to view and adjust Extended Parameters and value of P-37 + 100 to view and adjust Advanced Parameters. The code may be changed by the user in P-37 if desired.

### 7.2 EXTENDED PARAMETERS

| Par | Description | Minimum | Maximum | Default | Units |
| :---: | :---: | :---: | :---: | :---: | :---: |
| P-15 | Digital Input Function Select | 0 | 17 | 0 | - |
|  | Defines the function of the digital inputs depending on the control mode setting in P-12. See section 8 Analog and Digital Input Macro Configurations for more information. |  |  |  |  |
| P-16 | Analog Input 1 Signal Format |  |  | U0-10 |  |
|  | U $\quad \mathrm{B}-\mathrm{I}=0$ to 10 Volt Signal (Uni-polar). The drive will remain at 0.0 Hz if the analog reference after scaling and offset are applied is $=<0.0 \%$ b $\quad-i=0$ to 10 Volt Signal, bi-directional operation. The drive will operate the motor in the reverse direction of rotation if the analog reference after scaling and offset are applied is $<0.0 \%$. E.g. for bidirectional control from a $0-10$ volt signal, set P-35 $=200.0 \%, P-39=50.0 \%$ <br> R $0-20=0$ to 20 mA Signal <br> t $4-20=4$ to 20 mA Signal, the Answer Drives will trip and show the fault code $4-20 F$ if the signal level falls below 3 mA <br> r $4-20=4$ to 20 mA Signal, the Answer Drives will run at Preset Speed $1(P-20)$ if the signal level falls below 3 mA <br> $t \quad 20-4=20$ to 4 mA Signal, the Answer Drives will trip and show the fault code $4-20 \mathrm{~F}$ if the signal level falls below 3 mA <br> r $20-4=20$ to 4 mA Signal, the Answer Drives will run at Preset Speed 1 ( $\mathrm{P}-20$ ) if the signal level falls below 3 mA <br> U $\quad 0-0=10$ to 0 Volt Signal (Uni-polar). The drive will operate at Maximum Frequency / Speed if the analog reference after scaling and offset are applied is $=<0.0 \%$ |  |  |  |  |
| P-17 | Maximum Effective Switching Frequency | 4 | 32 | 8/16 | kHz |
|  | Sets maximum effective switching frequency of the drive. If "rEd" is displayed, the switching frequency has been reduced to the level in P00-32 due to excessive drive heatsink temperature. |  |  |  |  |
| P-18 | Output Relay Function Select | 0 | 7 | 1 |  |
|  | Selects the function assigned to the relay output. The relay has two output terminals, Logic 1 indicates the relay is active, and therefore terminals 10 and 11 will be connected. <br> 0 : Drive Enabled (Running). Logic 1 when the motor is enabled <br> 1 : Drive Healthy. Logic 1 when power is applied to the drive and no fault exists <br> 2 : At Target Frequency (Speed). Logic 1 when the output frequency matches the setpoint frequency <br> 3 : Drive Tripped. Logic 1 when the drive is in a fault condition <br> 4: Output Frequency >= Limit. Logic 1 when the output frequency exceeds the adjustable limit set in P-19 <br> 5 : Output Current >= Limit. Logic 1 when the motor current exceeds the adjustable limit set in P-19 <br> 6 : Output Frequency < Limit. Logic 1 when the output frequency is below the adjustable limit set in P-19 <br> 7 : Output Current < Limit. Logic 1 when the motor current is below the adjustable limit set in P-19 <br> 8 : Analog Input 2 > Limit. Logic 1 when the signal applied to analog input 2 exceeds the adjustable limit set in P-19 <br> 9 : Drive Ready to Run. Logic 1 when the drive is ready to run, no trip present. |  |  |  |  |
| P-19 | Relay Threshold Level | 0.0 | 200.0 | 100.0 | \% |
|  | Adjustable threshold level used in conjunction with settings 4 to 8 of P-18 |  |  |  |  |

| Par | Description | Minimum | Maximum | Default | Units |
| :---: | :---: | :---: | :---: | :---: | :---: |
| P-20 | Preset Frequency / Speed 1 | -P-01 | P-01 | 5.0 | Hz / RPM |
| P-21 | Preset Frequency / Speed 2 | -P-01 | P-01 | 25.0 | Hz / RPM |
| P-22 | Preset Frequency / Speed 3 | -P-01 | P-01 | 40.0 | Hz/RPM |
| P-23 | Preset Frequency / Speed 4 | -P-01 | P-01 | P-09 | Hz / RPM |
|  | Preset Speeds / Frequencies selected by digital inputs depending on the setting of P-15 If $\mathrm{P}-10=0$, the values are entered as Hz . If $\mathrm{P}-10>0$, the values are entered as RPM. NOTE: Changing the value of P-09 will reset all values to factory default settings |  |  |  |  |
| P-24 | $2^{\text {nd }}$ Deceleration Ramp Time (Fast Stop) | 0.00 | 600.0 | 0.00 | s |
|  | This parameter allows an alternative deceleration ramp down time to be programmed into the AD700E, which can be selected by digital inputs (dependent on the setting of $\mathrm{P}-15$ ) or selected automatically in the case of a mains power loss if $\mathrm{P}-05=2$ or 3 . When set to 0.00 , the drive will coast to stop. |  |  |  |  |
| P-25 | Analog Output Function Select | 0 | 10 | 8 |  |
|  | DIGITAL OUTPUT MODE. LOGIC $1=+24 \mathrm{~V}$ DC <br> 0 : Drive Enabled (Running). Logic 1 when the AD700E is enabled (Running) <br> 1 : Drive Healthy. Logic 1 When no Fault condition exists on the drive <br> 2: At Target Frequency (Speed). Logic 1 when the output frequency matches the setpoint frequency <br> 3: Drive Tripped. Logic 1 when the drive is in a fault condition <br> 4: Output Frequency >= Limit. Logic 1 when the output frequency exceeds the adjustable limit set in P-19 <br> 5 : Output Current >= Limit. Logic 1 when the motor current exceeds the adjustable limit set in P-19 <br> 6 : Output Frequency < Limit. Logic 1 when the output frequency is below the adjustable limit set in P-19 <br> 7 : Output Current < Limit. Logic 1 when the motor current is below the adjustable limit set in P-19 <br> ANALOG OUTPUT MODE <br> 8: Output Frequency (Motor Speed). 0 to $\mathrm{P}-01$, resolution 0.1 Hz <br> 9 : Output (Motor) Current. 0 to 200\% of P-08, resolution 0.1A <br> 10 : Output Power. $0-200 \%$ of drive rated power. |  |  |  |  |
| P-26 | Skip frequency hysteresis band | 0.0 | P-01 | 0.0 | Hz / RPM |
| P-27 | Skip Frequency Centre Point | 0.0 | P-01 | 0.0 | Hz / RPM |
|  | The Skip Frequency function is used to avoid the AD700E operating at a certain output frequency, for example at a frequency which causes mechanical resonance in a particular machine. Parameter P-27 defines the centre point of the skip frequency band, and is used in conjunction with P-26. The AD700E output frequency will ramp through the defined band at the rates set in P-03 and P-04 respectively, and will not hold any output frequency within the defined band. If the frequency reference applied to the drive is within the band, the AD700E output frequency will remain at the upper or lower limit of the band. |  |  |  |  |
| P-28 | V/F Characteristic Adjustment Voltage | 0 | P-07 | 0 | V |
| P-29 | V/F Characteristic Adjustment Frequency | 0.0 | P-09 | 0.0 | Hz |
|  | This parameter in conjunction with P-28 sets a frequency point at which the voltage set in P-29 is applied to the motor. Care must be taken to avoid overheating and damaging the motor when using this feature. |  |  |  |  |

| Par | Description | Minimum | Maximum | Default |  |
| :--- | :--- | :---: | :---: | :---: | :---: |
| P-30 | Start Mode \& Automatic Restart | N/A | N/A | Edge-r |  |
|  |  |  |  |  |  |

Selects whether the drive should start automatically if the enable input is present and latched during power on. Also configures the Automatic Restart function.
Ed9コ-r: Following Power on or reset, the drive will not start if Digital Input 1 remains closed. The Input must be closed after a power on or reset to start the drive
RULo- $\square$ : Following a Power On or Reset, the drive will automatically start if Digital Input 1 is closed
RULa- 1 to RULo-5 : Following a trip, the drive will make up to 5 attempts to restart at 20 second intervals. The numbers of restart attempts are counted, and if the drive fails to start on the final attempt, the drive will trip with a fault, and will require the user to manually reset the fault. The drive must be powered down to reset the counter

| P-31 | Keypad Start Mode Select | 0 | 7 | 1 | - |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

This parameter is active only when operating in Keypad Control Mode ( $\mathrm{P}-12=1$ or 2 ) or Modbus Mode ( $\mathrm{P}-12=3$ or 4 ). When settings 0 or 1 are used, the Keypad Start and Stop keys are active, and control terminals 1 and 2 must be linked together. Settings 2 and 3 allow the drive to be started from the control terminals directly, and the keypad Start and Stop keys are ignored.

## 0 : Minimum Speed, Keypad Start

1 : Previous Speed, Keypad Start
2 : Minimum Speed, Terminal Enable
3 : Previous Speed, Terminal Enable
4 : Current Speed, Keypad Start
5 : Preset Speed 4, Keypad Start
6 : Current Speed, Terminal Start
7 : Preset Speed 4, Terminal Star

| P-32 | Index 1 : Duration | 0.0 | 25.0 | 0.0 | 5 |
| :--- | :--- | :---: | :---: | :---: | :---: |
|  | Index 2 : DC Injection Mode | 0 | 2 | 0 | - |

Index 1: Defines the time for which a DC current is injected into the motor. DC Injection current level may be adjusted in P-59
Index 2 : Configures the DC Injection Function as follows
0 : DC Injection on Stop. DC is injected into the motor at the current level set in P-59 following a stop command, after the output frequency has reached 0.0 Hz for the time set in Index 1 . This can be useful to ensure the motor has reached a complete stop before the drive disables. Note If the drive is in Standby Mode prior to disable, the DC injection is disabled
1 : DC Injection on Start. DC is injected into the motor at the current level set in P-59 for the time set in Index 1 immediately after the drive is enabled, prior to the output frequency ramping up. The output stage remains active during this phase. This can be used to ensure the motor is at standstill prior to starting.
2 : DC Injection on Start \& Stop. DC injection applied as both settings 0 and 1 above.

| P-33 | Spin Start | 0 | 2 | 0 | - |
| :---: | :---: | :---: | :---: | :---: | :---: |

0 : Disabled
1 : Enabled. When enabled, on start up the drive will attempt to determine if the motor is already rotating, and will begin to control the motor from its current speed. A short delay may be observed when starting motors which are not turning.
2 : Enabled on Trip, Brown Out or Coast Stop. Spin start is only activated following the events listed, otherwise it is disabled.

## \&PREVIOUS VIEW

| Par | Description | Minimum | Maximum | Default | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| P-34 | Brake Chopper Enable (Not Size 1) | 0 | 4 | - |  |
|  | 0 |  |  |  |  |

## 0 : Disabled

1 : Enabled With Software Protection. Enables the internal brake chopper with software protection for a 200W continuous rated resistor
2 : Enabled Without Software Protection. Enables the internal brake chopper without software protection. An external thermal protection device should be fitted
3 : Enabled With Software Protection. As setting 1, however the Brake Chopper is only enabled during a change of the frequency setpoint, and is disabled during constant speed operation.
4: Enabled Without Software Protection. As setting 2, however the Brake Chopper is only enabled during a change of the frequency setpoint, and is disabled during constant speed operation

| P-35 | Analog Input 1 Scaling / <br> Slave Speed Scaling | 0.0 | 2000.0 | 100.0 | $\%$ |
| :--- | :--- | :--- | :--- | :--- | :--- |

Analog Input 1 Scaling. The analog input signal level is multiplied by this factor, e.g. if P-16 is set for a $0-10 \mathrm{~V}$ signal, and the scaling factor is set to $200.0 \%$, a 5 volt input will result in the drive running at maximum frequency / speed ( $\mathrm{P}-01$ )
Slave Speed Scaling. When operating in Slave Mode ( $\mathrm{P}-12=9$ ), the operating speed of the drive will be the Master speed multiplied by this factor, limited by the minimum and maximum speeds.

| P-36 | Serial Communications Configuration | See Below |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Index 1 : Address | 0 | 63 | 1 | - |
|  | Index 2 : Baud Rate | 9.6 | 1000 | 115.2 | kbps |
|  | Index 3 : Communication loss protection | 0 | 3000 | t 3000 | ms |

This parameter has three sub settings used to configure the Modbus RTU Serial Communications. The Sub Parameters are
$\mathbf{1}^{\text {st }}$ Index : Drive Address : Range : $0-63$, default: 1
$\mathbf{2}^{\text {nd }}$ Index : Baud Rate \& Network type : Selects the baud rate and network type for the internal RS485 communication port.
For Modbus RTU : Baud rates 9.6, 19.2, 38.4, 57.6, 115.2 kbps are available.
For CAN Open : Baud rates 125, 250, $500 \& 1000 \mathrm{kbps}$ are available.
$3^{\text {rd }}$ Index : Watchdog Timeout : Defines the time for which the drive will operate without receiving a valid command telegram to Register 1 (Drive Control Word) after the drive has been enabled. Setting 0 disables the Watchdog timer. Setting a value of 30, 100, 1000, or 3000 defines the time limit in milliseconds for operation. A " $t$ " suffix selects trip on loss of communication. An 'r' suffix means that the drive will coast stop (output immediately disabled) but will not trip.

| P-37 | Access Code Definition | 0 | 9999 | 101 | - |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Defines the access code which must be entered in P-14 to access parameters above P-14 |  |  |  |  |
| P-38 | Parameter Access Lock | 0 | 1 | 0 | - |
|  | 0 : Unlocked. All parameters can be accessed and changed <br> 1 : Locked. Parameter values can be displayed, but cannot be |  |  |  |  |

SPREVIOUS VIEW

| Par | Description | Minimum | Maximum | Default | Units |
| :---: | :---: | :---: | :---: | :---: | :---: |
| P-47 | Analog Input 2 Signal Format | - | - | - | U0-10 |
|  | ```US-ID=0 to 10 Volt Signal R B- DD = 0 to 20mA Signal t 4-2\square=4 to 20mA Signal, the AD700E will trip and show the fault code 4-20F if the signal level falls below 3mA r 4-20 = 4 to 20mA Signal, the AD700E will ramp to stop if the signal level falls below 3mA t 2D-4=20 to 4mA Signal, the AD700E will trip and show the fault code 4-2DF if the signal level falls below 3mA r 20-4 = 20 to 4mA Signal, the AD700E will ramp to stop if the signal level falls below 3mA Ptg-th = Use for motor thermistor measurement, valid with any setting of P-15 that has Input 3 as E-Trip. Trip level: 3k \Omega, reset 1k\Omega``` |  |  |  |  |
| P-48 | Standby Mode Timer | 0.0 | 25.0 | 0.0 | S |
|  | When standby mode is enabled by setting P-48>0.0, the drive will enter standby following a period of operating at minimum speed ( $\mathrm{P}-02$ ) for the time set in P-48. When in Standby Mode, the drive display shows 5tnd 5 , and the output to the motor is disabled. |  |  |  |  |
| P-49 | PI Control Wake Up Error Level | 0.0 | 100.0 | 5.0 | \% |
|  | When the drive is operating in PI Control Mode ( $\mathrm{P}-12=5$ or 6 ), and Standby Mode is enabled ( $\mathrm{P}-48>0.0$ ), $\mathrm{P}-49$ can be used to define the PI Error Level (E.g. difference between the setpoint and feedback) required before the drive restarts after entering Standby Mode. This allows the drive to ignore small feedback errors and remain in Standby mode until the feedback drops sufficiently. |  |  |  |  |
| P-50 | User Output Relay Hysteresis | 0.0 | 100.0 | 0.0 | \% |
|  | Sets the hysteresis level for P-19 to prevent the output relay chattering when close to the threshold. |  |  |  |  |

### 7.3 ADVANCED PARAMETERS

| Par | Description | Minimum | Maximum | Default | Units |
| :---: | :---: | :---: | :---: | :---: | :---: |
| P-51 | Motor Control Mode | 0 | 4 | 0 | - |
|  | 0 : Vector speed control mode <br> 1: V/f mode <br> 2: PM motor vector speed control <br> 3: BLDC motor vector speed control <br> 4: Synchronous Reluctance motor vector speed control |  |  |  |  |
| P-52 | Motor Parameter Autotune | 0 | 1 | 0 | - |
|  | 0 : Disabled <br> 1 : Enabled. When enabled, the drive immediately measures required data from the motor for optimal operation. Ensure all motor related parameters are correctly set first before enabling this parameter. <br> This parameter can be used to optimise the performance when $\mathrm{P}-51=0$. <br> Autotune is not required if P-51 $=1$. <br> For settings 2 - 4 of P-51, autotune MUST be carried out AFTER all other required motor settings are entered. |  |  |  |  |
| P-53 | Vector Mode Gain | 0.0 | 200.0 | 50.0 | \% |
|  | Single Parameter for Vector speed loop tuning. Affects P \& I terms simultaneously. Not active when P-51 = 1. |  |  |  |  |
| P-54 | Maximum Current Limit | 0.1 | 175.0 | 150.0 | \% |
|  | Defines the max current limit in vector control modes |  |  |  |  |
| P-55 | Motor Stator Resistance | 0.00 | 655.35 | - | $\Omega$ |
|  | Motor stator resistance in Ohms. Determined by Autotune, adjustment is not normally required. |  |  |  |  |
| P-56 | Motor Stator d-axis Inductance (Lsd) | 0 | 6553.5 | - | mH |
|  | Determined by Autotune, adjustment is not normally required. |  |  |  |  |
| P-57 | Motor Stator q-axis Inductance (Lsq) | 0 | 6553.5 | - | mH |
|  | Determined by Autotune, adjustment is not normally required. |  |  |  |  |
| P-58 | DC Injection Speed | 0.0 | P-01 | 0.0 | Hz / RPM |
|  | Sets the speed at which DC injection current is applied during braking to Stop, allowing DC to be injected before the drive reaches zero speed if desired. |  |  |  |  |
| P-59 | DC Injection Current | 0.0 | 100.0 | 20.0 | \% |
|  | Sets the level of DC injection braking current applied according to the conditions set in P-32 and P-58. |  |  |  |  |
| P-60 | Thermal Overload Retention | 0 | 1 | 0 | - |
|  | 0 : Disabled <br> 1: Enabled. When enabled, the drive calculated motor overload protection information is retained after the mains power is removed from the drive. |  |  |  |  |

### 7.4 P-00 READ ONLY STATUS PARAMETERS

| Par | Description | Explanation |
| :---: | :---: | :---: |
| P00-01 | $1{ }^{\text {st }}$ Analog input value (\%) | 100\% = max input voltage |
| P00-02 | $2^{\text {nd }}$ Analog input value (\%) | 100\% = max input voltage |
| P00-03 | Speed reference input (Hz / RPM) | Displayed in Hz if $\mathrm{P}-10=0$, otherwise RPM |
| P00-04 | Digital input status | Drive digital input status |
| P00-05 | User PI output (\%) | Displays value of the User PI output |
| P00-06 | DC bus ripple (V) | Measured DC bus ripple |
| P00-07 | Applied motor voltage (V) | Value of RMS voltage applied to motor |
| P00-08 | DC bus voltage (V) | Internal DC bus voltage |
| P00-09 | Heatsink temperature ( ${ }^{\circ} \mathrm{C}$ ) | Temperature of heatsink in ${ }^{\circ} \mathrm{C}$ |
| P00-10 | Run time since date of manuf. (Hours) | Not affected by resetting factory default parameters |
| P00-11 | Run time since last trip (1) (Hours) | Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred. Reset also on next enable after a drive power down. |
| P00-12 | Run time since last trip (2) (Hours) | Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred (under-volts not considered a trip) - not reset by power down / power up cycling unless a trip occurred prior to power down |
| P00-13 | Trip Log | Displays most recent 4 trips with time stamp |
| P00-14 | Run time since last disable (Hours) | Run-time clock stopped on drive disable, value reset on next enable |
| P00-15 | DC bus voltage log (V) | 8 most recent values prior to trip, 256 ms sample time |
| P00-16 | Heatsink temperature $\log$ (V) | 8 most recent values prior to trip, 30 s sample time |
| P00-17 | Motor current log (A) | 8 most recent values prior to trip, 256 ms sample time |
| P00-18 | DC bus ripple $\log (\mathrm{V})$ | 8 most recent values prior to trip, 22 ms sample time |
| P00-19 | Internal drive temperature $\log \left({ }^{\circ} \mathrm{C}\right)$ | 8 most recent values prior to trip, 30 s sample time |
| P00-20 | Internal drive temperature ( ${ }^{\circ} \mathrm{C}$ ) | Actual internal ambient temperature in ${ }^{\circ} \mathrm{C}$ |
| P00-21 | CANopen process data input | Incoming process data (RX PDO1) for CANopen: Pl1, Pl2, PI3, Pl4 |
| P00-22 | CANopen process data output | outgoing process data (TX PDO1) for CANopen: PO1, PO2, PO3, PO4 |
| P00-23 | Accumulated time with heatsink $>85^{\circ} \mathrm{C}$ (Hours) | Total accumulated hours and minutes of operation above heatsink temp of $85^{\circ} \mathrm{C}$ |
| P00-24 | Accumulated time with drive internal temp $>80^{\circ} \mathrm{C}$ (Hours) | Total accumulated hours and minutes of operation with drive internal ambient above 80C |
| P00-25 | Estimated rotor speed (Hz) | In vector control modes, estimated rotor speed in Hz |
| P00-26 | kWh meter / MWh meter | Total number of kWh / MWh consumed by the drive. |
| P00-27 | Total run time of drive fans (Hours) | Time displayed in hh:mm:ss. First value displays time in hrs, press up to display mm:ss. |
| P00-28 | Software version and checksum | Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates power stage |
| P00-29 | Drive type identifier | Drive rating, drive type and software version codes |
| P00-30 | Drive serial number | Unique drive serial number |

## 8 ANALOG AND DIGITAL INPUT MACRO CONFIGURATIONS

### 8.1 OVERVIEW

AD700E uses a Macro approach to simplify the configuration of the Analog and Digital Inputs. There are two key parameters which determine the input functions and drive behaviour:

- P -12 - Selects the main drive control source and determines how the output frequency of the drive is primarily controlled
- P-15 - Assigns the Macro function to the analog and digital inputs.

Additional parameters can then be used to further adapt the settings, e.g. - P-16 - Used to select the format of the analog signal to be connected to analog input 1, e.g. $0-10$ Volt, $4-20 \mathrm{~mA}$

- P-30 - Determines whether the drive should automatically start
following a power on if the Enable Input is present
- P-31 - When Keypad Mode is selected, determines at what output frequency / speed the drive should start following the enable command, and also whether the keypad start key must be pressed or if the Enable input alone should start the drive.
- P-47 - Used to select the format of the analog signal to be connected to analog input 2, e.g. $0-10$ Volt, $4-20 \mathrm{~mA}$

The diagrams below provide an overview of the functions of each terminal macro function, and a simplified connection diagram for each.

### 8.2 MACRO FUNCTIONS GUIDE KEY

## STOP / RUN

Forward Rotation/ Reverse Rotation

Al1 REF
P-xx REF
PR-REF
^-FAST STOP (P-24)-^ When both inputs are active simultaneously, the drive stops using Fast Stop Ramp Time P-24

E-TRIP External Trip input, which must be Normally Closed. When the input opens, the drive trips showing $E-t r$ i $P$ or Ptc-th depending on P-47 setting Normally Open Contact, Momentarily Close to Start Normally Closed Contact, momentary Open to Stop Activates Fire Mode, see section 8.7 Fire Mode Hardware Enable Input. In Keypad Mode, P-31 determines whether the drive immediately starts, or the keypad start key must be pressed. In other modes, this input must be present before the start signal via the fieldbus interface
Normally Open, Close the input to Increase the motor speed
Normally Open, Close input to Decrease motor speed Keypad Speed Reference selected
Selected speed reference from Fieldbus (Modbus RTU / CAN Open / Master depending on P -12 setting)

### 8.7 FIRE MODE

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation. The Fire Mode input must be closed for norma operation - removing the signal from this input will cause the drive to enter Fire Mode. This input may be linked to a fire control system, so that in the event of a fire in the building and drive operation is required to be maintained for the longest possible period in order to clear smoke or maintain air quality within that building
The fire mode function is enabled when $\mathrm{P}-15=15,16$ or 17 , with Digital Input 3 assigned to activate fire mode.
Fire Mode disables the following protection features in the drive
O-t (Heat-sink Over-Temperature), U-t(Drive Under Temperature), Th-FLt (Faulty Thermistor on Heat-sink), E-trip (External Trip), 4-20 F (4-20mA fault), Ph-Ib (Phase Imbalance), P-Loss (Input Phase Loss Trip), SC-trp (Communications Loss Trip), I_t-trp (Accumulated overload Trip) The following faults will result in a drive trip, auto reset and restart: O-Volt (Over Voltage on DC Bus), U-Volt (Under Voltage on DC Bus), h O(Fast Over-current Trip), O-I (Instantaneous over current on drive output), Out-F (Drive output fault, Output stage trip)

## \&PREVIOUS VIEW

## 9 MODBUS RTU COMMUNICATIONS

### 9.1 INTRODUCTION

The AD700E can be connected to a Modbus RTU network via the RJ45 connector on the front of the drive.

### 9.2 MODBUS RTU SPECIFICATION

| Protocol | Modbus RTU |
| :--- | :--- |
| Error check | CRC |
| Baud rate | 9600bps, 19200bps, 38400bps, 57600bps, 115200bps (default) |
| Data format | 1 start bit, 8 data bits, 1 stop bits, no parity. |
| Physical signal | RS 485 (2-wire) |
| User interface | RJ45 |

### 9.3 RJ45 CONNECTOR CONFIGURATION

For full MODBUS RTU register map information please refer to your NIDEC representative. Local contacts can be found by visiting our website www.nidec-industrial.com

When using MODBUS control the Analog and Digital Inputs can be configured as shown in section 9.5

No Connection

## No Connectio

+ RS485 (Modbus RTU)
+RS485 (Modbus RTU)

## Warning:

This is not an Ethernet
connection. Do not connec
directly to an Ethernet port.

### 9.4 MODBUS TELEGRAM STRUCTURE

The AD700E supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0, therefore it may be necessary to convert the Register Numbers detail in section 9.5 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:

| Command 03 - Read Holding Registers |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Master Telegram | Length |  | Slave Response | Length |  |
| Slave Address | 1 | Byte | Slave Address | 1 | Byte |
| Function Code (03) | 1 | Byte | Starting Address | 1 | Byte |
| $1^{\text {st }}$ Register Address | 2 | Bytes | $1^{\text {st }}$ Register Value | 2 | Bytes |
| No. Of Registers | 2 | Bytes | $2^{\text {nd }}$ Register Value | 2 | Bytes |
| CRC Checksum | 2 | Bytes | Etc... |  |  |
|  |  |  | CRC Checksum | 2 | Bytes |

| Command 06 - Write Single Holding Register |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Master Telegram | Length |  | Slave Response | Length |  |
| Slave Address | 1 | Byte | Slave Address | 1 | Byte |
| Function Code (06) | 1 | Byte | Function Code (06) | 1 | Byte |
| Register Address | 2 | Bytes | Register Address | 2 | Bytes |
| Value | 2 | Bytes | Register Value | 2 | Bytes |
| CRC Checksum | 2 | Bytes | CRC Checksum | 2 | Bytes |
|  |  |  |  |  |  |

### 9.5 MODBUS REGISTER MAP

| Register <br> Number | Par. | Type | Supported Commands | Function |  | Range | Explanation |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Low Byte | High Byte |  |  |
| 1 | - | R/W | 03,06 | Drive Control Command |  | $0 . .3$ | 16 Bit Word. <br> Bit 0 : Low = Stop, High = Run Enable <br> Bit 1 : Low = Decel Ramp 1 (P-04), High = Decel Ramp 2 (P-24) <br> Bit 2 : Low = No Function, High = Fault Reset <br> Bit 3 : Low - No Function, High = Coast Stop Request |
| 2 | - | R/W | 03,06 | Modbus Speed reference setpoint |  | $0 . .5000$ | Setpoint frequency $\times 10$, e.g. $100=10.0 \mathrm{~Hz}$ |
| 4 | - | RMW | 03,06 | Acceleration and Deceleration Time |  | $0 . .60000$ | Ramp time in seconds $\times 100$, e.g. $250=2.5$ seconds |
| 6 | - | R | 03 | Error code | Drive status |  | Low Byte = Drive Error Code, see section 10.1 High Byte = Drive Status as follows : <br> 0 : Drive Stopped <br> 1: Drive Running <br> 2: Drive Tripped |
| 7 |  | R | 03 | Output Motor Frequency |  | 0.20000 | Output frequency in $\mathrm{Hz} \times 10$, e.g. $100=10.0 \mathrm{~Hz}$ |
| 8 |  | R | 03 | Output Motor Current |  | $0 . .480$ | Output Motor Current in Amps x10, e.g. $10=1.0$ Amps |
| 11 | - | R | 03 | Digital input status |  | $0 . .15$ | Indicates the status of the 4 digital inputs Lowest Bit = 1 Input 1 |
| 20 | P00-01 | R | 03 | Analog Input 1 value |  | $0 . .1000$ | Analog input \% of full scale $\times 10$, e.g. $1000=100 \%$ |
| 21 | P00-02 | R | 03 | Analog Input 2 value |  | $0 . .1000$ | Analog input \% of full scale $\times 10$, e.g. $1000=100 \%$ |
| 22 | P00-03 | R | 03 | Speed Reference Value |  | $0 . .1000$ | Displays the setpoint frequency $\times 10$, e.g. $100=10.0 \mathrm{~Hz}$ |
| 23 | P00-08 | R | 03 | DC bus voltage |  | $0 . .1000$ | DC Bus Voltage in Volts |
| 24 | P00-09 | R | 03 | Drive temperature |  | $0 . .100$ | Drive heatsink temperature in ${ }^{\circ} \mathrm{C}$ |

All user configurable parameters are accessible as Holding Registers, and can be Read from or Written to using the appropriate Modbus command. The Register number for each parameter P-04 to P-047 is defined as $128+$ Parameter number, e.g. for parameter P-15, the register number is $128+$ $15=143$. Internal scaling is used on some parameters, for further details, please contact your NIDEC representative www.nidec-industrial.com

## 10 TECHNICAL DATA

### 10.1 ENVIRONMENTAL

Operational ambient temperature range Open Drives: $-10 \ldots 50^{\circ} \mathrm{C}$ (frost and condensation free) Enclosed Drives: $-10 \ldots 40^{\circ} \mathrm{C}$ (frost and condensation free)
Storage ambient temperature range: $-40 \ldots 60^{\circ} \mathrm{C}$
Maximum altitude:
Maximum humidity 95\%, non-condensing

NOTE:
For UL compliance: the average ambient temperature over a 24 hour period for $200-240 \mathrm{~V}, 2.2 \mathrm{~kW}$ and $3 \mathrm{HP}, \mathrm{IP} 20$ drives is $45^{\circ} \mathrm{C}$

## Electrical Installation Requirements

Incoming power supply connection must be according to sections 5.4 and 5.5
Suitable Power and motor cables should be selected according to the data shown in section 10.2 and the National Electrical Code or other applicable local codes.

| Motor Cable | $75^{\circ} \mathrm{C}$ Copper must be used |
| :--- | :--- |

Power cable connections and tightening torques are shown in sections 4.3 and 4.5
Integral Solid Sate short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the national electrical code and any additional local codes. Ratings are shown in section 10.2
Transient surge suppression must be installed on the line side of this equipment and shall be rated 480 Volt (phase to ground), 480 Volt (phase to phase) suitable for over voltage category III and shall provide protection for a rated impulse withstand voltage peak of 4 kV .
UL Listed ring terminals / lugs must be used for all bus bar and grounding connections

## General Requirements

AD700E provides motor overload protection in accordance with the National Electrical Code (US)

- Where a motor thermistor is not fitted, or not utilised, Thermal Overload Memory Retention must be enabled by setting P-60 = 1
- Where a motor thermistor is fitted and connected to the drive, connection must be carried out according to the information shown in section 5.7.2

## 11 TROUBLE SHOOTING

## 11．1 FAULT CODE MESSAGES

| Fault Code | No． | Description | Suggested Remedy |
| :---: | :---: | :---: | :---: |
| no－Fit | 00 | No Fault | Not required |
| －1－b | 01 | Brake channel over current | Check external brake resistor condition and connection wiring |
| OL－br | 02 | Brake resistor overload | The drive has tripped to prevent damage to the brake resistor |
| －－1 | 03 | Output Over Current | Instantaneous Over current on the drive output．Excess load or shock load on the motor． |
| 1＿t－trP | 04 | Motor Thermal Overload（12t） | The drive has tripped after delivering $>100 \%$ of value in P－08 for a period of time to prevent damage to the motor． |
| PS－trP | 05 | Power stage trip | Check for short circuits on the motor and connection cable |
| B－uolt | 06 | Over voltage on DC bus | Check the supply voltage is within the allowed tolerance for the drive．If the fault occurs on deceleration or stopping，increase the deceleration time in P－04 or install a suitable brake resistor and activate the dynamic braking function with P－34 |
| U－volt | 07 | Under voltage on DC bus | The incoming supply voltage is too low．This trip occurs routinely when power is removed from the drive．If it occurs during running，check the incoming power supply voltage and all components in the power feed line to the drive． |
| $\square-t$ | 08 | Heatsink over temperature | The drive is too hot．Check the ambient temperature around the drive is within the drive specification．Ensure sufficient cooling air is free to circulate around the drive． Increase the panel ventilation if required．Ensure sufficient cooling air can enter the drive，and that the bottom entry and top exit vents are not blocked or obstructed． |
| $U-t$ | 09 | Under temperature | Trip occurs when ambient temperature is less than $-10^{\circ} \mathrm{C}$ ．Temperature must be raised over $-10^{\circ} \mathrm{C}$ in order to start the drive． |
| P－dEF | 10 | Factory Default parameters loaded |  |
| E－tr，P | 11 | External trip | E－trip requested on digital input 3．Normally closed contact has opened for some reason． If motor thermistor is connected check if the motor is too hot． |
| 55－065 | 12 | Comms loss | Check communication link between drive and external devices．Make sure each drive in the network has its unique address． |
| FLE－dC | 13 | DC bus ripple too high | Check incoming supply phases are all present and balanced |
| P－L055 | 14 | Input phase loss trip | Check incoming power supply phases are present and balanced． |
| h $\square^{-1}$ | 15 | Output Over Current | Check for short circuits on the motor and connection cable |
